SUMMARY

Software engineer specializing in distributed systems, search, and data infrastructure, with a track record of leading cross-org architecture and execution for mission-critical platforms at massive scale. Delivered multi-million-dollar savings, major latency reductions, and reusable infrastructure adopted across teams.

EXPERIENCE

Stripe *Jul 2019 - Present*

Software Engineer, Search & Data Infrastructure

- Architected and drove a cross-company overhaul of Dashboard list-view serving, replacing fragmented backends with a unified event-driven search platform; coordinated enrichment, massive backfills, and phased rollout, cutting organization-wide list-view load times from 15s to 5s and establishing a broadly adopted architectural standard.
- Designed a reusable migration platform to repartition 26B documents across 32 TB with parallel execution, checkpointed recovery, and live dual writes, enabling large-scale infrastructure upgrades without product-code changes.
- Rearchitected search ingestion for 450 TB across five Elasticsearch clusters, saving $3M annually, tripling per-processor throughput, and reducing p99.9 ingestion lag by 90% to under 12 seconds.
- Optimized legacy indexing through CPU profiling and query analysis, eliminating 235M database reads daily, reducing p99 hydration latency by 90%, and saving $291K annually.
- Delivered secure cross-user caching for Trino-backed analytics, returning cache hits in ~100 ms while preserving fine-grained authorization, reducing redundant computation, and enabling scalable live-query dashboards.
- Authored and published two AI agent plugins to the internal marketplace for Trino query triage and cluster scaling reports, with deterministic AST-based config parsing to avoid LLM hallucination, so the whole team can run reliable, repeatable on-call analysis.
- Implemented India data-residency compliance through regional ingestion, cross-cluster search, and mTLS while maintaining availability; mentored an intern on context-aware search authorization in partnership with Security and IAM.

Flipkart *Mar 2015 - Nov 2016*

Software Development Engineer

- Core member of a team that designed and built a configurable, fault-tolerant accounting service to validate, enrich, and audit organization-wide accounting events at low latency.
- Designed and built TaaS, a RESTful service for asynchronous test execution and automated email reporting.

Evernote *May 2018 - Aug 2018*

Software Engineer Intern

- Designed and developed a Java gRPC microservice to manage note-content data in a dynamically sharded MySQL store, and modified the Java backend to use multi-version concurrency control for distributed transactions.
- Reduced load on a single-point-of-failure datastore by ~15% by identifying a hot table and executing a zero-downtime migration to a separate datastore.

SKILLS

Languages: Java, Python, Go, Ruby, C++

Data & Infrastructure: Elasticsearch, Trino, MySQL, MongoDB, Redis, Bigtable, DynamoDB, Kubernetes, Docker, Spark, Hadoop, HDFS, RabbitMQ

Distributed Systems: gRPC, search and indexing systems, large-scale data migration, event-driven architectures

EDUCATION

M.S. Computer Science - Intelligent Systems, University of Texas at Dallas | 2019

B.E. Computer Science & Engineering, Anna University, India | 2015
